

# Varun G

GenAI Developer

📍 Bengaluru 📞 +91-9731416185 🎙 varungangu1@gmail.com 💬 LinkedIn 💬 Medium

## Summary

GenAI Developer specializing in enterprise AI solutions with 4+ years of Python development experience. Proven track record of reducing operational time by 95% through AI-powered automation (GRD project). Expert in building RAG-based chatbots, document processing pipelines, and data extraction systems using Langchain, Langgraph, and GPT-4o. Awarded for innovative AI solutions at MITC Hackathon 2024.

## Experience

### Merck Group

GenAI developer

2024-Present

Bengaluru

- Proficient in developing AI-powered applications with a focus on Generative AI.
- Expertise in building conversational AI systems, document processing pipelines, and data extraction solutions.
- Hands-on experience with Langchain, Langgraph and vector databases like Qdrant for efficient document retrieval and multi-modal data access.
- Proven ability to optimize complex processes, significantly improving operational efficiency and reducing task completion times.
- Award-winning innovator, recognized for delivering cutting-edge AI solutions in hackathons and internal competitions.

### Merck Group

Python developer

2021-2024

Bengaluru

- Engineered and implemented a comprehensive end-to-end data transformation pipeline, revolutionising the company's data processing capabilities.
- Developed robust Python scripts to extract and parse complex, multi-sheet Excel files, handling various data formats and inconsistencies
- Implemented data cleaning and validation procedures, including handling of missing values and data type standardization, ensuring data integrity
- Integrated automated data quality checks and error logging mechanisms, significantly reducing manual intervention and improving data reliability
- Enabled the creation of interactive Tableau dashboards and reports, empowering stakeholders with real-time, data-driven insights for strategic decision-making

### Merck Group

Application support engineer

2019-2021

Bengaluru

- Started professional career as an Application Support Engineer, demonstrating strong technical foundation and problem-solving skills
- Provided comprehensive support for both GxP (Good Practice) and Non-GxP applications, ensuring regulatory compliance and operational efficiency
- Developed expertise in critical process workflows, including Request for Change (RFC) and change management procedures, contributing to streamlined operations and risk mitigation

<b>Projects</b>	<b>GRD (Global Response Document)</b> GenAI Summarisation App	<b>2024-Present</b>
	<p>Developed an AI-powered application to generate Global Response Documents (GRDs) for healthcare professionals, reducing the GRD creation time from 3–4 hours to just 10–20 minutes. The solution included a document preprocessing pipeline using PyMuPDF for text extraction and AWS Textract for table extraction. Tailored system prompts were created based on user-selected Therapeutic Area (TA), product, and GRD type, while a batch processing system enabled efficient multi-page document handling. Using a single-shot prompting approach, the application maintained a scientific tone and format. Integrated with the GPT-4o model via Langchain for both data extraction and summarization, the app featured a Streamlit-based user interface for easy interaction and document uploading. It also provided a citation system for page-level references and generated output in downloadable Word format for seamless distribution and editing.</p>	
	Python, Langchain, Streamlit, PyMuPDF, AWS Textract, GPT-4o	
	<b>BrAIn (Breeze AI Navigator)</b> GenAI Chatbot	<b>2023-2024</b>
	<p>Developed an AI chatbot with access to Breeze SOPs and training documents, supported by an automated data ingestion pipeline using AWS Lambda, S3, and SharePoint. Leveraging Azure OpenAI's text-embedding-3-large model and Qdrant DB, we built a vector store for efficient document retrieval. The chatbot's interface was created using Streamlit with a Python and Langchain backend, incorporating multi-vector retrieval for parent-child document relationships and context-aware conversations using router and question reframe chains. Powered by the GPT-4o model, the chatbot delivers accurate responses with a citation system providing page-level references from source documents.</p>	
	Python, Azure OpenAI, Qdrant, Streamlit, Langchain, SharePoint, AWS, Lambda, S3	
	<b>PACO (Protocol Analysis for Complexity Optimisation)</b> GenAI Data Extraction App	<b>2023-2024</b>
	<p>Developed an AI-powered application to extract structured data from unstructured Word and PDF documents, featuring a document processing pipeline using PyMuPDF and the Unstructured library. The application included a user-friendly Streamlit interface for document uploading and result downloading. Custom system prompts were engineered for various extraction tasks, including JSON schema specifications, and Langchain's structured output function ensured consistent JSON-formatted results. Powered by the GPT-4o model for high-accuracy information extraction, the app implemented a batch processing system to parallelize tasks and improve efficiency. Additionally, we developed a conversion process to transform extracted JSON data into a downloadable Excel format for easy user review.</p>

<b>Projects</b>	<b>Text to SQL Conversational App POC</b>	<b>2023-2024</b>	
	Developed a proof-of-concept application enabling natural language queries on Foundry data tables, featuring a conversational AI system using the GPT-4o model and Langgraph for agentic workflows. A SQL query agent was designed to convert natural language inputs into accurate SQL queries, supported by a custom tool to execute these queries on Foundry tables and retrieve relevant data. An answer agent analyzed query results and generated human-readable responses. The application included a Streamlit-based interface for seamless user interaction, integrating table schema information and custom system prompts to improve query accuracy and enhance data accessibility through natural language interaction.		
	Python, Langgraph, Streamlit, GPT-4o, SQL, Foundry		
	<b>MiNE</b> Report generation tool	<b>Oct 2025 - Present</b>	
	Built an AI-powered tool that automatically creates reports by gathering information from multiple sources (social media, scientific articles, and medical data). Designed a two-step process: first, the system extracts key information from user questions to quickly filter through millions of database records; second, it uses smart retrieval methods to find the most relevant data and generate accurate reports.
